

Project 3

Scenario

Your company wants to distribute their content in the form of a website to their global offices. However, due to some legal restrictions, you cannot distribute the content in France and Australia. You need to find a way to prevent these offices from accessing the data.

The content does not change very often; however, some of the files are very large, and you have to find a solution to minimize end user latency.

The last requirement is that the audit department wants to track whoever is accessing the website.

Goals of the project

- Set up a static website using Amazon S3.
 - Create a bucket and enable static website hosting.
 - Enable logging.
- Set up a CloudFront distribution for the static website with Access Logs enabled.
- Set up Geo Restrictions to prevent users in France and Australia from accessing the data.
- Verify that logging is working.
